Abstract of the Disclosure

A content comprises contiguous blocks containing a program
stream and interleaved blocks containing interleaved program
streams, wherein the program streams are divided into program units
and are readable independently of one another, and the occurrence of
consecutive interleaved blocks is forbidden. The content is enhanced
as follows. Each program unit of the enhancement program stream is
associated with a program unit of the original program stream. The
enhancement program stream is interleaved in the content at the
program unit level such that enhancement program units are as close
as possible to the original program unit they are associated with.
The occurrence of consecutive interleaved block is avoided; and the
original program units point to the enhancement program units they
are associated with.
